

# FIRST SEMESTER MCA (2020 SCHEME)

Practical Examination June 2021

20 MCA185 DATA STRUCTURES LAB

Date: 30-6-2021

Time: 9:30 am - 12:30 pm.

Submitted by

Anjana.V

ICE20MCA2012

## 1. merging of two arrays

### Algorithm

Step 1: Start

Step 2: declare 3 integer array and variable  $m, n, i, j, k = 0$

Step 3: Read the no. of elements in First array as  $m$   
and Read the elements in First array,

Step 4: Read the no. of elements in Second array as  $n$   
and read the elements in second array,

Step 5: Initialize  $i$  and  $j$  as 0.

Step 6: repeat Step 7 to Step 10. until  $i < m$  &  $j < n$

Step 7: check if  $a[i] < b[j]$  then.

Step 8: assign the element  $a[i]$  to  $c[k]$  and increment  $i$  by 1.

Step 9: else assign the element  $b[j]$  to  $c[k]$

Step 10: Increment  $j$  by 1 and  $k$  by 1

Step 11: check if  $i \geq m$  then.

Step 12: repeat Step 13 to Step 14 until  $j < n$ .

Step 13: assign the element in  $a$  &  $b[j]$  to  $c[k]$

Step 14: Increment  $j$  and  $k$  by 1.

Step 15: Check  $j \geq n$  then

Step 16: Repeat Step 17 to Step 18 until  $j \geq m$

Step 17: Assign the element in  $a[i]$  to  $d[k]$ .

Step 18: Increment  $j$  and  $k$  by 1

Step 19: Point the merged array.

Step 20: Stop.

### Default input and output

#### Input

Element First array 1 2 3

Element in second array 5 6 7 9

#### Output

Merged array: 1 2 3 5 6 7 9

### Program code

```
#include <stdio.h>
```

```
#include <conio.h>
```

```
void main()
```

```
{ int arr1[50], arr2[50], arr3[100], m, n, i, j, k=0;
```

```
printf("Enter the number of element in 1st array: \n");  
scanf("%d", &m);
```

```
printf("Enter the number of elements: \n");
```

```
for(i=0; i<m; i++)
```

```
scanf("%d", &arr1[i]);
```

```
printf("Enter the no. of element in 2nd array: \n");
```

```
scanf("%d", &n);
```

```
printf("Enter the elements");
```

```
for(i=0; i<n; i++)
```

```
scanf("%d", &arr2[i]);
```

```
i=0; j=0;
```

```
while (i < m && j < n)
```

```
{ if (arr1[i] < arr2[j])
```

```
{ arr3[k] = arr1[i];
```

```
i++;
```

```
}
```

```
else
```

```
arr3[k] = arr2[j];
```

```
j++
```

```
}
```

```
k++;
```

```
}
```

```
if (i >= m)
```

```
while (j < n)
```

```
{ arr3[k] = arr2[j];
```

```
j++; k++;
```

```
}
```

```
}
```

```
if (j >= n)
```

```
{ while (i < m)
```

```
{ arr3[k] = arr1[i];
```

```
i++; j++;
```

```
}
```

```
}
```

```
printf("merged array: \n");
```

```
for (i=0; i < m; i++)
```

```
{ printf("%d", arr3[i]);
```

```
}
```

```
getch();
```

```
}
```

2. implement circular queue.

### Algorithm

- Step 1: Start
- Step 2: define max as 5
- Step 3: declare an integer array of size max and few variable as front and rear initialize them with 0.
- Step 4: declare two integer variables choice item.
- Step 5: repeat Step 4 to Step 11. until choice 1.
- Step 6: Print the menu and read choice as
- Step 7: repeat Step 7 to Step 11 until 19 choice is 1
- Step 8: read the value as item.
- Step 9: call the insert function.
- Step 10: If choice is 2 <sup>call</sup> deletion function.
- Step 11: If choice is 3 call display function
- Step 12: If choice is 4 exit
- Step 13: stop.

### Insert Function

- Step 1: Start
- Step 2: check front = 0 and rear = max - 1 then.
- Step 3: print queue overflow and return.
- Step 4: check if front = -1 then,
- Step 5: Set front and rear as 0
- Step 6: else, check if rear = max - 1 then,
- Step 7: Set rear as 0
- Step 8: else, increment rear by 1
- Step 9: assign item to the array

## Deletion Function

- Step 1 : Start
- Step 2 : Check if  $\text{front} = -1$  then,
- Step 3 : Print queue overflow and return.
- Step 4 : Print the element deleted from the queue
- Step 5 : Check if  $(\text{front} == \text{rear})$  then,
- Step 6 :  $\text{front}$  and  $\text{rear}$  as  $-1$
- Step 7 : else, check if  $\text{front} = \text{max} - 1$  then,
- Step 8 : Assign  $\text{front}$  as 0
- Step 9 : else increment  $\text{front}$  by 1
- Step 10 : Stop

## Display Function

- Step 1 : Start
- Step 2 : Initialize  $\text{front} - \text{pos} = \text{front}$  and  $\text{rear} - \text{pos} = \text{rear}$
- Step 3 : Check if  $\text{front} = -1$  then,
- Step 4 : Print queue is empty and return.
- Step 5 : Print the queue elements
- Step 6 : Check if  $\text{front} - \text{pos} \leq \text{rear} - \text{pos}$
- Step 7 : Repeat Step 8 to Step 8 until  $\text{front} - \text{pos} < \text{rear} - \text{pos}$ .
- Step 8 : Print the value of  $\text{front} - \text{pos}$  and increment  $\text{front} - \text{pos}$  by 1
- Step 9 : else repeat Step 10 to until  $\text{front} - \text{pos} \leq \text{max} - 1$
- Step 10 : Print  $\text{front} - \text{pos}$  in array and increment  $\text{front} - \text{pos}$  by 1
- Step 11 : Set  $\text{front} - \text{pos}$  as 0
- Step 12 : Repeat Step 13 to Step 14 until  $\text{front} - \text{pos} \leq \text{rear} - \text{pos}$

Step 13: Print Value of front in array

Step 14: Increment front-pos by 1

Step 15: Stop.

Default input and output

Choice: 1

element: 23

Choice: 1

element: 25

Choice: 2:

deleted element is 23

Choice 3

Queue element are 25.

Program code

```
#include <stdio.h>
```

```
#include <conio.h>
```

```
#define MAX 5
```

```
int Queue = arr[MAX];
```

```
int front = -1; int rear = -1;
```

```
void Insert (int item)
```

```
{  
    if ((front == 0 && rear == MAX - 1) || (front == rear))
```

```
{  
        printf ("Queue overflow");  
        return;
```

```
}  
if (front == -1)
```

```
{  
    front = 0, rear = 0;
```

else

if (rear == MAX - 1)

rear = 0;

else

rear = rear + 1;

}

Queue[rear] = item;

}

void deletion()

{ if (front == -1)

{ Print ("Queue underflow");

return;

}

Print ("element deleted from Queue is %d\n", Queue[front]);

if (front == rear)

{ front = -1, rear = -1;

}

else

{ if (front == MAX - 1)

front = 0;

else

front = front + 1;

}

}

void display()

{ int front\_pos = front, rear\_pos = rear;

if (front == -1)

{

Print ("Queue is empty\n");

return;

}

Print ("Queue element\n");

if (front\_pos <= rear\_pos)

while (front\_pos <= rear\_pos)

{ Print ("%d", Queue[front\_pos]);

front\_pos++;

else

```
{ while (front - pos < - max - 1)
```

```
{ printf("%d", Queue - arr[front - pos]);
```

```
front - pos ++;
```

```
}
```

```
void main ()
```

```
{ int choice, item;
```

```
do
```

```
{ printf("1. Insertion\n 2. deletion\n 3. Display\n 4. Exit\n");
```

```
